- Cools the heated coolant before it returns to the engine
- Often equipped with an electric fan to improve airflow

2. Water Pump

- Circulates coolant throughout the system
- Driven by a belt connected to the engine or an electric motor (in electric pumps)
- Maintains consistent flow to prevent hotspots

3. Thermostat

- Regulates coolant flow based on temperature
- Opens to allow coolant flow when engine reaches operating temperature
- Closes to restrict flow when the engine is cold, aiding in fast warm-up

4. Coolant Hoses

- Connect various components, facilitating coolant flow
- Include upper and lower radiator hoses, heater hoses, and bypass hoses

5. Coolant/Antifreeze

- The fluid that absorbs and transports heat
- Typically a mixture of water and glycol to prevent freezing and boiling

6. Expansion Tank (Coolant Reservoir)

Flow of Coolant in the Lincoln Navigator Cooling System

Understanding the coolant flow is crucial for interpreting the Lincoln Navigator cooling system diagram. The typical flow process includes:

- Coolant Circulation from the Water Pump

The water pump pushes coolant from the engine block into the radiator via the upper radiator hose.

- Heat Dissipation in the Radiator

As coolant passes through the radiator, heat is transferred to the radiator fins and air passing through, cooling the fluid.

- Return to the Engine

Cooled coolant exits the radiator through the lower radiator hose and re-enters the engine block.

- Thermostat Regulation

The thermostat determines when the coolant begins circulating through the radiator based on engine temperature, opening once the engine reaches a specified temperature.

- Expansion Tank Role

As the coolant heats, it expands and flows into the expansion tank, preventing pressure buildup. When cooled, the coolant is drawn back into the system.

- Cooling Fan Activation

When engine temperature exceeds a threshold, sensors trigger the cooling fans to increase airflow through the radiator.
