Below are representative examples of questions that may appear on page 69, along with detailed answers to aid understanding.

Question 1: Describe the main layers of the Earth and their properties.

Answer:

The Earth is composed of four main layers:

- Inner Core: Solid, primarily iron and nickel; about 1,220 km thick; responsible for Earth's magnetic field.
- Outer Core: Liquid, also mainly iron and nickel; approximately 2,200 km thick; generates Earth's magnetic field through convection.
- Mantle: Semi-solid, composed of silicate rocks rich in magnesium and iron; extends to about 2,900 km below the surface; involved in mantle convection and plate movements.
- Crust: The Earth's outermost layer; solid and relatively thin (5-70 km thick); includes continental and oceanic crust.

Understanding these layers helps explain phenomena like seismic waves, volcanic activity, and tectonic movements.

Question 2: What is the significance of plate tectonics in Earth's geology?

Answer:

Plate tectonics explains the movement of Earth's lithospheric plates on the semi-fluid asthenosphere beneath them. This movement is responsible for:

- The formation of mountains, earthquakes, and volcanoes
- The creation and destruction of ocean basins
- The distribution of continents and oceanic features

The theory of plate tectonics revolutionized Earth Science by providing a unifying explanation for many geological phenomena, emphasizing Earth's dynamic nature.

Question 3: How does the rock cycle operate?

Answer:

The rock cycle illustrates how rocks are transformed through geological processes:

- Igneous rocks: Form from cooled magma or lava
- Sedimentary rocks: Created through compaction and cementation of sediments
- Metamorphic rocks: Result from the alteration of existing rocks due to heat, pressure, or chemically active fluids
