Processes are grouped into batches with similar requirements and processed sequentially without user interaction.

Time-Sharing Operating System

Multiple users share system resources simultaneously, with rapid context switching providing the illusion of concurrent access.

Distributed Operating System

Manages a group of distinct computers and makes them appear as a single system.

Real-Time Operating System (RTOS)

Designed for real-time applications where timely processing is critical, such as embedded systems.

Multiprocessor Operating System

Supports multiple processors working together, increasing computational power.

Key Concepts and Terminologies in Operating Systems

This section explains important concepts often tested through objective questions.

Process Scheduling Algorithms

- First Come First Serve (FCFS): Processes are scheduled in the order they arrive.
- Round Robin (RR): Processes are assigned a fixed time quantum in cyclic order.
- Shortest Job First (SJF): The process with the shortest burst time is scheduled next.
- Priority Scheduling: Processes are scheduled based on priority levels.

Memory Management Techniques

- Contiguous Allocation: Memory blocks are assigned to processes sequentially.
- Paging: Divides memory into fixed-size pages.
- Segmentation: Divides memory into segments based on logical divisions.
- Virtual Memory: Uses disk space to extend RAM capacity.

Deadlock Prevention and Avoidance

- Prevention: Ensuring that at least one of the necessary conditions for deadlock does not occur.
- Avoidance: Using algorithms like Banker's Algorithm to avoid unsafe states.

Synchronization Mechanisms

- Semaphores: Used for controlling access to shared resources.
- Mutexes: Ensure mutual exclusion.
- Monitors: High-level synchronization constructs.

Common Operating System Interview Questions

Preparing for interviews requires understanding typical questions and model answers.

1. Explain the concept of process synchronization.

Process synchronization ensures that multiple processes or threads can operate safely in a shared environment, preventing race conditions and data inconsistency. Synchronization mechanisms like semaphores, mutexes, and monitors coordinate process execution to avoid conflicts.

2. What are the advantages of multi-threading?

- Better resource utilization
- Faster execution
- Increased application responsiveness
- Simplified program structure for concurrent tasks

3. How does virtual memory work?

Virtual memory allows a computer to compensate for physical memory shortages by temporarily transferring data from RAM to disk storage. It enables processes to use more memory than physically available, with the OS managing paging and swapping.

4. What is a context switch?

A context switch is the process of storing and restoring the state of a CPU so that multiple processes can share a single CPU. It involves saving the current process state and loading the next process's state.

5. Describe the concept of deadlock prevention.

Deadlock prevention involves designing the system in a way that at least one of the four necessary conditions for deadlock (mutual exclusion, hold and wait, no preemption, circular wait) is never allowed. Techniques include resource ordering and preemptive resource allocation.

Sample Operating System Objective Questions & Answers

- What is the primary function of an operating system?

- a) To manage hardware resources
- b) To perform user applications
- c) To connect multiple computers
- d) To compile source code

Answer: a) To manage hardware resources

Explanation:

The main role of an operating system is to act as an intermediary between hardware and user applications. It manages hardware resources such as CPU, memory, disk drives, and peripherals, ensuring efficient and secure operation. While OS facilitates user applications, its fundamental task revolves around resource management.

- Which scheduling algorithm assigns the CPU to the process with the shortest burst time?

- a) First-Come, First-Served (FCFS)
- b) Round Robin
- c) Shortest Job First (SJF)
- d) Priority Scheduling

Answer: c) Shortest Job First (SJF)

Explanation:

Shortest Job First scheduling selects the process with the least estimated CPU burst time. It minimizes average waiting time but can lead to starvation of longer processes. SJF is a non-preemptive algorithm that improves throughput in many scenarios.

- True or False: Virtual memory allows physical memory to be larger than the actual RAM installed.

Answer: False

Explanation:

Virtual memory enables the system to use disk space as an extension of RAM, giving an illusion of a larger address space. It does not make physical memory larger; instead, it provides a way to manage memory more efficiently, swapping data between RAM and disk as needed.

- Which of the following is NOT a characteristic of a real-time operating system?

- a) Deterministic response
- b) Prioritized scheduling
- c) High throughput for batch processing
- d) Guarantees of deadlines

Answer: c) High throughput for batch processing

Explanation:

Real-time OS are designed for predictable, deterministic responses to events, often used in embedded systems and safety-critical applications. High throughput for batch processing is not their primary focus; that is more relevant to general-purpose OS.

- In the context of deadlocks, which condition must be present for a deadlock to occur?

- a) Mutual exclusion
- b) Hold and wait
- c) No preemption
- d) All of the above

Answer: d) All of the above

Explanation:

A deadlock occurs when all four necessary conditions are present simultaneously: mutual exclusion, hold and wait, no preemption, and circular wait. Preventing any one of these conditions can help avoid deadlocks.

- Which file allocation method allows for direct access to any block?

- a) Sequential allocation
- b) Indexed allocation
- c) Contiguous allocation
- d) Both b and c

Answer: d) Both b and c

Explanation:

Contiguous allocation and indexed allocation allow direct access to specific blocks, enabling faster access. Sequential allocation, on the other hand, accesses files sequentially.

- What is the role of a device driver?

- a) To manage the operating system kernel
- b) To facilitate communication between the OS and hardware devices

- c) To schedule processes
- d) To handle user authentication

Answer: b) To facilitate communication between the OS and hardware devices

Explanation:

Device drivers are specialized programs that enable the OS to communicate and control hardware devices like printers, disk drives, and network cards. They abstract hardware details, providing a standard interface.

- Which of the following is used to prevent race conditions in concurrent processes?

- a) Deadlocks
- b) Semaphores
- c) Polling
- d) Paging

Answer: b) Semaphores

Explanation:

Semaphores are synchronization tools used to control access to shared resources, thus preventing race conditions and ensuring mutual exclusion in concurrent processing.
