Making liquid soaps with sodium laureth sulphate

Creating liquid soaps using sodium laureth sulphate (SLES) is a popular choice among soap makers and cosmetic formulators due to its excellent foaming properties, cleansing ability, and relatively mild nature when formulated correctly. SLES is a surfactant derived from ethoxylated lauryl alcohol, which provides the base for many liquid cleansers and shampoos. This article explores the detailed process of making liquid soap with sodium laureth sulphate, including the necessary ingredients, equipment, formulation techniques, and important considerations for safety and quality.

Understanding Sodium Laureth Sulphate

What is Sodium Laureth Sulphate?

Sodium laureth sulphate is an anionic surfactant widely used in personal care products. It is known for its excellent foaming and cleaning capabilities, making it a staple in shampoos, body washes, and facial cleansers. Chemically, SLES is produced by ethoxylating lauryl alcohol and then neutralizing it with sodium carbonate, resulting in a mild yet effective surfactant.

Properties of Sodium Laureth Sulphate

- **Foamability:** Produces rich, stable foam
- **Cleaning Power:** Effectively removes oils, dirt, and impurities
- **Mildness:** Less irritating than some other sulphates when properly formulated
- **Solubility:** Soluble in water, making it ideal for liquid formulations
- **Viscosity:** Contributes to the desired thickness of the final product

Safety and Regulatory Considerations

While SLES is generally considered safe for use in cosmetics, it can cause irritation if used in high concentrations or if contaminated with impurities like 1,4-dioxane. It's vital to source high-quality, certified SLES and adhere to recommended usage levels.

- The ethoxylation process reduces harshness, making it suitable for skin contact

Advantages of SLES:

- Excellent foaming capacity
- Cost-effective
- Compatible with other surfactants and thickeners
- Readily available in various grades

Limitations:

- Can cause irritation in sensitive skin if used excessively
- Potential contamination with 1,4-dioxane during manufacturing, though reputable suppliers minimize this risk

Basics of Liquid Soap Formulation

Creating liquid soap involves blending surfactants, water, humectants, thickeners, preservatives, and optional additives like fragrances and colorants. The goal is to produce a stable, aesthetically pleasing, and effective cleansing product.

Core components:

- Surfactant (SLES): Primary cleansing agent
- Water: Solvent and diluent
- Thickener: To adjust viscosity

- Preservative: To prevent microbial growth
- Additives: Fragrances, colorants, skin conditioners

Step-by-Step Process of Making Liquid Soap with SLES

1. Gathering Materials and Equipment

Materials:

- Sodium laureth sulfate (SLES)
- Distilled or purified water
- Thickening agents (e.g., salt, xanthan gum, or cocamidopropyl betaine)
- Preservatives (e.g., phenoxyethanol, sodium benzoate)

- Mixing containers (preferably stainless steel or high-grade plastic)
- Stirring tools (silicone spatula or spoon)
- Digital scale for precise measurements
- pH meter or pH strips
- Measuring cups and graduated cylinders
- Heating source (if needed for certain thickeners)

2. Preparing the Base Solution

a. Dilution of SLES:

- Typically, SLES is used at 10-20% concentration in the final product.
- To prepare a base, dilute SLES with water to desired concentration, often around 10-15%.
- Example: For 1 liter of liquid soap, use approximately 100-150 grams of SLES diluted with distilled water.

b. Mixing:

- Slowly add SLES to water while stirring gently to prevent foaming or splashing.
- Ensure complete mixing without creating excessive foam.

3. Adjusting pH

- The typical pH of liquid soap should be between 7.0 and 8.5.
- Measure pH after initial mixing.
- Adjust if necessary:
- Acidify with citric acid or lactic acid if pH is too high.
- Use sodium hydroxide (NaOH) solution cautiously if pH needs raising.
- Proper pH adjustment ensures skin compatibility and stability.

4. Adding Thickeners and Stabilizers

Common thickening methods:

- Salt (Sodium Chloride):
- Adding 1-3% salt can increase viscosity by reducing surfactant micelle size.
- Dissolve salt in a small amount of water and slowly add to the mixture with stirring.
- Hydrophilic Thickening Agents:
- Xanthan Gum: Dissolve in water separately, then add gradually.
- Cocamidopropyl Betaine: A co-surfactant that also acts as a thickener, enhancing foam and mildness.
- Heat Activation:
- Some thickeners work better at slightly elevated temperatures (around 40-50°C).

Procedure:

- Add thickener gradually to avoid clumping.
- Stir continuously until fully dissolved and the desired viscosity is achieved.

5. Incorporating Preservatives and Additives

Preservation:

- Add a broad-spectrum preservative compatible with SLES, such as phenoxyethanol or sodium

benzoate, to prevent microbial contamination.

- Follow manufacturer's recommended dosage.

Fragrance and Colorants:

- Add fragrance oils or essential oils for scent.
- Incorporate colorants in small amounts for aesthetic appeal.
- Mix thoroughly to ensure uniform distribution.

- Add glycerin, aloe vera extract, or other skin conditioners to enhance moisturizing properties.

6. Final Adjustments and Packaging

- Re-measure pH and adjust if necessary.
- Check viscosity and modify as needed by adding more salt or thickening agents.
- Conduct stability tests, such as storing samples for a few weeks to observe separation or precipitation.
- Transfer the finished liquid soap into bottles or dispensers.

Safety Considerations in Making Liquid Soap with SLES

- Always wear gloves and eye protection when handling surfactants to prevent skin and eye irritation.
- Work in well-ventilated areas to avoid inhaling fumes or aerosols.
- Store SLES and other chemicals out of reach of children.
- Use high-quality, food-grade or cosmetic-grade SLES to ensure safety.
- Be cautious with pH adjustments to prevent skin irritation.

Tips for Customizing Your Liquid Soap

- Enhance Mildness: Combine SLES with milder surfactants like cocamidopropyl betaine or decyl glucoside.
- Increase Foam: Incorporate foaming boosters like coco betaine or decyl glucoside.
- Add Moisturizers: Glycerin, aloe vera, or oat extracts improve skin hydration.

- Create Scent Variations: Use essential oils like lavender, tea tree, or citrus for personalized fragrances.
- Adjust Viscosity: Salt is an economical option, but xanthan gum provides a more stable and controlled thickening.

Common Challenges and Troubleshooting

- Separation or Phase Issues: Ensure proper pH adjustment and thorough mixing.
- Low Viscosity: Increase salt or incorporate thickeners.
- Overly Thick or Gelled Product: Dilute with water or reduce thickening agents.
- Foaming Problems: Add co-surfactants or foaming agents compatible with SLES.
- Microbial Growth: Use effective preservatives and maintain hygienic manufacturing conditions.

Environmental and Regulatory Aspects

- Be aware of local regulations regarding the use and labeling of surfactants.
- Use environmentally friendly preservatives and biodegradable ingredients.
- Properly dispose of waste and unused chemicals per local guidelines.
