Sample Questions with Answers for Your Managerial Finance Exam

Financial Analysis and Planning

Question 1:

Given the following financial statements, calculate the company's current ratio.

| Current Assets | \$150,000 |

|-----|-----|

| Current Liabilities | \$75,000 |

Answer:

The current ratio = Current Assets / Current Liabilities = \$150,000 / \$75,000 = 2.0

This indicates that the company has twice as many current assets as current liabilities, reflecting good short-term liquidity.

Time Value of Money

Question 2:

What is the present value of receiving \$10,000 in 3 years if the discount rate is 8%?

Answer:

$PV = FV / (1 + r)^n = \$10,000 / (1 + 0.08)^3 = \$10,000 / 1.2597 \approx \$7,938$

Therefore, the present value of \$10,000 received in 3 years at an 8% discount rate is approximately \$7,938.

Cost of Capital

Question 3:

A firm has issued bonds with a coupon rate of 6%, and the current market price of the bonds is \$950. The bonds pay semi-annual coupons, and their face value is \$1,000. Calculate the approximate cost of debt.

Answer:

Using the approximate formula:

Cost of debt = (Coupon payment / Price) + (Face value - Price) / Years to maturity

Assuming a maturity of 10 years:

Coupon payment = 6% of \$1,000 = \$60 annually, or \$30 semi-annually.

Approximate yield:

Yield = [Coupon payment + (Face value - Price) / Years] / [(Price + Face value) / 2]

= [\$60 + (\$1,000 - \$950)/10] / [(\$950 + \$1,000)/2] = [\$60 + \$5] / \$975 = \$65 / \$975 = 6.67%

Thus, the approximate cost of debt is about 6.67%.

Capital Budgeting and Investment Appraisal

Question 4:

A project requires an initial investment of \$100,000. It is expected to generate cash flows of \$25,000 annually for 6 years. If the discount rate is 10%, should the project be accepted based on NPV?

Answer:

Calculate NPV:

NPV = (Cash flow / (1 + r)^t) - Initial Investment

NPV = (\$25,000 × PVIFA at 10%, 6 years) - \$100,000

PVIFA (10%, 6) ? 4.3553

$NPV = \$25,000 \times 4.3553 - \$100,000 = \$108,883 - \$100,000 = \$8,883$

Since $NPV > 0$, the project should be accepted.

Risk and Return Analysis

Question 5:

If a stock has an expected return of 12% and a beta of 1.2, and the risk-free rate is 3%, what is the expected return according to CAPM?

Answer:

CAPM formula:

$\text{Expected return} = R_f + \beta (R_m - R_f)$

Assuming the market return R_m is 10%:

$\text{Expected return} = 3\% + 1.2 \times (10\% - 3\%) = 3\% + 1.2 \times 7\% = 3\% + 8.4\% = 11.4\%$

The expected return based on CAPM is 11.4%, close to the given 12%, indicating the stock is fairly valued.

- Working capital management
- Risk and return analysis
- Capital structure decisions
- Dividend policy

A good grasp of these topics is essential for performing well in any managerial finance exam.

Sample Exam Questions with Answers

Providing sample questions along with thorough answers can significantly aid your preparation. Here, we present some typical exam questions categorized by topic.

1. Time Value of Money

Question:

Calculate the present value of a \$10,000 payment to be received in 5 years if the discount rate is 8%.

Answer:

The present value (PV) of a future sum is calculated using the formula:

$$PV = FV / (1 + r)^n$$

Where:

FV = Future value = \$10,000

r = Discount rate = 8% or 0.08

n = Number of years = 5

$$PV = 10,000 / (1 + 0.08)^5$$

$$PV = 10,000 / (1.08)^5$$

$$PV = 10,000 / 1.4693$$

$$PV = \$6,807.97$$

Explanation:

The present value of \$10,000 received in 5 years at an 8% discount rate is approximately \$6,808. This calculation illustrates the time value of money principle, emphasizing that money today is worth more than the same amount in the future.

2. Capital Budgeting

Question:

A project requires an initial investment of \$50,000 and is expected to generate cash flows of \$15,000 annually for 5 years. If the company's required rate of return is 10%, should the project be accepted based on the net present value (NPV)?

Answer:

First, calculate the present value of the cash inflows:

$$PV \text{ of annuity} = C \times [(1 - (1 + r)^{-n}) / r]$$

Where:

$$C = \text{Annual cash flow} = \$15,000$$

$$r = 10\% = 0.10$$

$$n = 5 \text{ years}$$

$$PV = 15,000 \times [(1 - (1 + 0.10)^{-5}) / 0.10]$$

$$PV = 15,000 \times [(1 - 1 / (1.10)^5) / 0.10]$$

$$PV = 15,000 \times [(1 - 1 / 1.6105) / 0.10]$$

$$PV = 15,000 \times [(1 - 0.6209) / 0.10]$$

$$PV = 15,000 \times [0.3791 / 0.10]$$

$$PV = 15,000 \times 3.791$$

$$PV = \$56,865$$

Next, calculate NPV:

$$NPV = PV \text{ of inflows} - \text{Initial investment}$$

$$NPV = \$56,865 - \$50,000$$

$$NPV = \$6,865$$

Conclusion:

Since the NPV is positive (~\$6,865), the project should be accepted as it adds value to the firm.

3. Cost of Capital

Question:

A company has the following sources of financing:

- Equity: \$1,000,000 with a cost of 12%
- Debt: \$500,000 with a cost of 6%
- The corporate tax rate is 30%

Calculate the company's weighted average cost of capital (WACC).

Answer:

WACC formula:

$$WACC = (E / V) \times Re + (D / V) \times Rd \times (1 - Tc)$$

Where:

$$E = \text{Equity} = \$1,000,000$$

$$D = \text{Debt} = \$500,000$$

$$V = E + D = \$1,500,000$$

$$Re = \text{Cost of equity} = 12\%$$

$$Rd = \text{Cost of debt} = 6\%$$

$$Tc = \text{Tax rate} = 30\%$$

Calculations:

$$WACC = (1,000,000 / 1,500,000) \times 0.12 + (500,000 / 1,500,000) \times 0.06 \times (1 - 0.30)$$

$$WACC = (0.6667 \times 0.12) + (0.3333 \times 0.06 \times 0.70)$$

$$WACC = 0.0800 + 0.0140$$

$$WACC = 0.094 \text{ or } 9.4\%$$

Interpretation:

The company's weighted average cost of capital is approximately 9.4%, which is a critical figure for investment and financing decisions.

4. Financial Statement Analysis

Question:

A firm's current assets are \$200,000, and its current liabilities are \$150,000. Its quick assets (excluding inventory) are \$120,000, and its total assets are \$500,000. Calculate the current ratio and quick ratio, and interpret their significance.

Answer:

- Current Ratio:

Current Ratio = Current Assets / Current Liabilities

= \$200,000 / \$150,000 = 1.33

- Quick Ratio:

Quick Assets / Current Liabilities = \$120,000 / \$150,000 = 0.80

Interpretation:

- A current ratio of 1.33 suggests the firm has sufficient short-term assets to cover its current liabilities, indicating good liquidity.

- The quick ratio of 0.80 indicates that excluding inventory, the firm does not have enough liquid assets to meet immediate obligations. This may signal potential liquidity issues if quick assets are needed to cover short-term liabilities.

Joel Dean: Life and Academic Contributions

Biographical Snapshot

Joel Dean (1908-2004) was an American economist and professor renowned for his pioneering work in managerial economics. His academic career was primarily associated with Columbia University, where he sought to bridge the gap between economic theory and business practice. Dean's approach emphasized analytical rigor, clarity, and applicability, making his work accessible to both scholars and practicing managers.

Major Publications and Their Significance

Dean authored several influential texts, with his most notable being *Managerial Economics* (first published in 1951). This book became a cornerstone in the field, widely adopted in business schools worldwide. It offered a systematic framework for understanding economic concepts in managerial contexts, emphasizing decision-making processes and quantitative analysis.

Core Concepts in Joel Dean's Approach to Managerial Economics

- The Emphasis on Decision-Making Under Uncertainty

Dean believed that managers operate in environments fraught with uncertainty. His framework advocates for analyzing risks, employing probabilistic models, and using economic reasoning to make optimal decisions despite incomplete information.

- Cost-Volume-Profit Analysis

A significant contribution from Dean is his clear exposition of cost-volume-profit (CVP) analysis, which helps managers understand how changes in costs, volume, and prices affect profitability. He detailed how to derive breakeven points and margin of safety, tools crucial for strategic planning.

- Marginal Analysis and Optimization

Dean championed the principle of marginalism—analyzing incremental changes—to guide decisions

such as pricing, output levels, and investment. His teachings stress that managers should compare marginal benefits with marginal costs to achieve optimal outcomes.

- Price and Output Determination

In his writings, Dean provided frameworks for understanding how firms determine prices and output levels in different market structures. He explored monopoly, oligopoly, and perfect competition, emphasizing strategic considerations like product differentiation and entry barriers.

- The Role of Market Structure and Competition

Dean underscored the importance of understanding market dynamics. His analyses demonstrated how market structure influences managerial decisions, with a focus on strategic behavior, barriers to entry, and competitive forces.

Methodological Innovations and Pedagogical Approach

Quantitative Techniques

Dean was an advocate of rigorous quantitative analysis, integrating algebra, calculus, and statistical methods into managerial decision-making. His texts often included mathematical models to illustrate economic principles, fostering a more analytical mindset among students and practitioners.

Simplification of Complex Concepts

Despite his emphasis on mathematical rigor, Dean was committed to making complex ideas accessible. His writing style combined clarity with depth, enabling readers to grasp intricate concepts without sacrificing analytical precision.

Educational Impact

Dean's textbooks became standard references in business education, influencing curricula worldwide. His approach encouraged a systematic, disciplined way of thinking about managerial problems, emphasizing logical reasoning and empirical analysis.

His emphasis on practical applications, coupled with analytical methods, helped elevate managerial economics from a theoretical discipline to a pragmatic tool for managers.

Practical Applications in Business

Many firms and managers adopted Dean's frameworks for pricing strategies, cost management, and strategic planning. His models are still referenced today in business case studies, especially in industries where cost control and market analysis are critical.

Critiques and Limitations

While Dean's contributions are widely celebrated, some critiques highlight that his models sometimes oversimplify complex market behaviors or assume rationality that may not always exist in real-world scenarios. Nonetheless, his work provides a robust starting point for managerial analysis.

Contemporary Relevance of Joel Dean's Principles

Adapting Dean's Frameworks in Modern Business

In an era characterized by rapid technological change, globalization, and data-driven decision-making, Dean's core principles remain relevant. Modern managerial economics incorporates advanced computational tools, but the fundamental concepts of marginal analysis, cost behavior, and market structure analysis continue to underpin strategic decisions.

Implications for Business Education

Dean's pedagogical approach continues to influence curricula, emphasizing analytical rigor, quantitative skills, and decision-oriented thinking. His work encourages future managers to approach problems systematically, balancing theory with practical insights.

Integration with Modern Techniques

Contemporary managerial economics integrates Dean's principles with modern tools like econometric modeling, game theory, and big data analytics. This synthesis enhances decision-making precision and strategic foresight.

Conclusion

The Enduring Legacy of Joel Dean in Managerial Economics

Joel Dean's pioneering efforts in articulating and systematizing economic principles for managerial use have cemented his place as a foundational figure in the field. His emphasis on analytical clarity, decision-making under uncertainty, and practical application continues to resonate in business schools and corporate strategy alike.
